

Package ‘RKorAPClient’

August 8, 2023

Type Package

Title 'KorAP' Web Service Client Package

Version 0.7.7

Description A client package that makes the 'KorAP' web service API accessible from R. The corpus analysis platform 'KorAP' has been developed as a scientific tool to make potentially large, stratified and multiply annotated corpora, such as the 'German Reference Corpus DeReKo' or the 'Corpus of the Contemporary Romanian Language CoRoLa', accessible for linguists to let them verify hypotheses and to find interesting patterns in real language use. The 'RKorAPClient' package provides access to 'KorAP' and the corpora behind it for user-created R code, as a programmatic alternative to the 'KorAP' web user-interface. You can learn more about 'KorAP' and use it directly on 'DeReKo' at <https://korap.ids-mannheim.de/>.

Depends R (>= 3.5.0)

association-score-functions

Association score functions

Description

Functions to calculate different collocation association scores between a node (target word) and words in a window around the it. The functions are primarily used by `collocationScoreQuery()`.

pmi: pointwise mutual information

mi2: pointwise mutual information squared (Daille 1994), also referred to as mutual dependency (Thanopoulos et al. 2002)

mi3: pointwise mutual information cubed (Daille 1994), also referred to as log-frequency biased mutual dependency) (Thanopoulos et al. 2002)

logDice: log-Dice coefficient, a heuristic measure that is popular in lexicography (Rychlý 2008)

ll: log-likelihood (Dunning 1993) using Stefan Evert's (2004) simplified implementation

Usage

```
defaultAssociationScoreFunctions()  
  
pmi(O1, O2, O, N, E, window_size)  
  
mi2(O1, O2, O, N, E, window_size)  
  
mi3(O1, O2, O, N, E, window_size)  
  
logDice(O1, O2, O, N, E, window_size)  
  
ll(O1, O2, O, N, E, window_size)
```

Arguments

| | |
|-------------|--|
| O1 | observed absolute frequency of node |
| O2 | observed absolute frequency of collocate |
| O | observed absolute frequency of collocation |
| N | corpus size |
| E | expected absolute frequency of collocation (already adjusted to window size) |
| window_size | total window size around node (left neighbour count + right neighbour count) |

Value

association score

Examples

```
## Not run:

new("KorAPConnection", verbose = TRUE) %>%
  collocationScoreQuery("Perlen", c("verziertes", "Säue"),
    scoreFunctions = append(defaultAssociationScoreFunctions(),
      list(localMI = function(O1, O2, O, N, E, window_size) {
        O * log2(O/E)
      })))

## End(Not run)
```

 ci

Add confidence interval and relative frequency variables

Description

Using `prop.test()`, `ci` adds three columns to a data frame:

1. relative frequency (`f`)
2. lower bound of a confidence interval (`ci.low`)
3. upper bound of a confidence interval

Convenience function for converting frequency tables to instances per million.

Convenience function for converting frequency tables of alternative variants (generated with `as.alternatives=TRUE`) to percent.

Converts a vector of query or `vc` strings to typically appropriate legend labels by clipping off prefixes and suffixes that are common to all query strings.

Experimental convenience function for plotting typical frequency by year graphs with confidence intervals using `ggplot2`. **Warning:** This function may be moved to a new package.

Usage

```
ci(df, x = totalResults, N = total, conf.level = 0.95)
```

```
ipm(df)
```

```
percent(df)
```

```
queryStringToLabel(data, pubDateOnly = FALSE, excludePubDate = FALSE)
```

```
geom_freq_by_year_ci(mapping = aes(ymin = conf.low, ymax = conf.high), ...)
```

Arguments

| | |
|----------------|---|
| df | table returned from <code>frequencyQuery()</code> |
| x | column with the observed absolute frequency. |
| N | column with the total frequencies |
| conf.level | confidence level of the returned confidence interval. Must be a single number between 0 and 1. |
| data | string or vector of query or vc definition strings |
| pubDateOnly | discard all but the publication date |
| excludePubDate | discard publication date constraints |
| mapping | Set of aesthetic mappings created by <code>aes()</code> or <code>aes_()</code> . If specified and <code>inherit.aes = TRUE</code> (the default), it is combined with the default mapping at the top level of the plot. You must supply mapping if there is no plot mapping. |
| ... | Other arguments passed to <code>geom_ribbon</code> , <code>geom_line</code> , and <code>geom_click_point</code> . |

Details

Given a table with columns `f`, `conf.low`, and `conf.high`, `ipm` adds a column `ipm` and multiplies `conf.low` and `conf.high` with 10^6 .

Value

original table with additional column `ipm` and converted columns `conf.low` and `conf.high`
 original table with converted columns `f`, `conf.low` and `conf.high`
 string or vector of strings with clipped off common prefixes and suffixes

See Also

`ci` is already included in `frequencyQuery()`

Examples

```
## Not run:

library(ggplot2)
kco <- new("KorAPConnection", verbose=TRUE)
expand_grid(year=2015:2018, alternatives=c("Hate Speech", "Hatespeech")) %>%
  bind_cols(corpusQuery(kco, .$alternatives, sprintf("pubDate in %d", .$year))) %>%
  mutate(total=corpusStats(kco, vc=vc)$tokens) %>%
  ci() %>%
  ggplot(aes(x=year, y=f, fill=query, color=query, ymin=conf.low, ymax=conf.high)) +
  geom_point() + geom_line() + geom_ribbon(alpha=.3)

## End(Not run)
## Not run:

new("KorAPConnection") %>% frequencyQuery("Test", paste0("pubDate in ", 2000:2002)) %>% ipm()
```

```

## End(Not run)
## Not run:

new("KorAPConnection") %>%
  frequencyQuery(c("Tollpatsch", "Tolpatsch"),
    vc=paste0("pubDate in ", 2000:2002),
    as.alternatives = TRUE) %>%
  percent()

## End(Not run)
queryStringToLabel(paste("textType = /Zeit.* / & pubDate in", c(2010:2019)))
queryStringToLabel(c("[marmot/m=mood:subj]", "[marmot/m=mood:ind]"))
queryStringToLabel(c("wegen dem [tt/p=NN]", "wegen des [tt/p=NN]"))

## Not run:
library(ggplot2)
kco <- new("KorAPConnection", verbose=TRUE)

expand_grid(condition = c("textDomain = /Wirtschaft.* /", "textDomain != /Wirtschaft.* /"),
  year = (2005:2011)) %>%
  cbind(frequencyQuery(kco, "[tt/l=Heuschrecke]",
    paste0(.$condition," & pubDate in ", .$year))) %>%
  ipm() %>%
  ggplot(aes(year, ipm, fill = condition, color = condition)) +
  geom_freq_by_year_ci()

## End(Not run)

```

collocationAnalysis,KorAPConnection-method
Collocation analysis

Description

[Experimental]

Performs a collocation analysis for the given node (or query) in the given virtual corpus.

Usage

```

## S4 method for signature 'KorAPConnection'
collocationAnalysis(
  kco,
  node,
  vc = "",
  lemmatizeNodeQuery = FALSE,
  minOccur = 5,
  leftContextSize = 5,
  rightContextSize = 5,
  topCollocatesLimit = 200,

```

```

searchHitsSampleLimit = 20000,
ignoreCollocateCase = FALSE,
withinSpan = ifelse(exactFrequencies, "base/s=s", ""),
exactFrequencies = TRUE,
stopwords = append(RKorAPClient::synsemanticStopwords(), node),
seed = 7,
expand = length(vc) != length(node),
maxRecurse = 0,
addExamples = FALSE,
thresholdScore = "logDice",
threshold = 2,
localStopwords = c(),
collocateFilterRegex = "^[:alnum:]+-?[:alnum:]*$",
...
)

```

Arguments

| | |
|-----------------------|---|
| kco | KorAPConnection() object (obtained e.g. from <code>new("KorAPConnection")</code>) |
| node | target word |
| vc | string describing the virtual corpus in which the query should be performed. An empty string (default) means the whole corpus, as far as it is license-wise accessible. |
| lemmatizeNodeQuery | if TRUE, node query will be lemmatized, i.e. <code>x -> [tt/l=x]</code> |
| minOccur | minimum absolute number of observed co-occurrences to consider a collocate candidate |
| leftContextSize | size of the left context window |
| rightContextSize | size of the right context window |
| topCollocatesLimit | limit analysis to the n most frequent collocates in the search hits sample |
| searchHitsSampleLimit | limit the size of the search hits sample |
| ignoreCollocateCase | logical, set to TRUE if collocate case should be ignored |
| withinSpan | KorAP span specification for collocations to be searched within |
| exactFrequencies | if FALSE, extrapolate observed co-occurrence frequencies from frequencies in search hits sample, otherwise retrieve exact co-occurrence frequencies |
| stopwords | vector of stopwords not to be considered as collocates |
| seed | seed for random page collecting order |
| expand | if TRUE, node and vc parameters are expanded to all of their combinations |
| maxRecurse | apply collocation analysis recursively maxRecurse times |

| | |
|-----------------------------------|---|
| <code>addExamples</code> | If TRUE, examples for instances of collocations will be added in a column example. This makes a difference in particular if node is given as a lemma query. |
| <code>thresholdScore</code> | association score function (see association-score-functions) to use for computing the threshold that is applied for recursive collocation analysis calls |
| <code>threshold</code> | minimum value of <code>thresholdScore</code> function call to apply collocation analysis recursively |
| <code>localStopwords</code> | vector of stopwords that will not be considered as collocates in the current function call, but that will not be passed to recursive calls |
| <code>collocateFilterRegex</code> | allow only collocates matching the regular expression |
| <code>...</code> | more arguments will be passed to collocationScoreQuery() |

Details

The collocation analysis is currently implemented on the client side, as some of the functionality is not yet provided by the KorAP backend. Mainly for this reason it is very slow (several minutes, up to hours), but on the other hand very flexible. You can, for example, perform the analysis in arbitrary virtual corpora, use complex node queries, and look for expression-internal collocates using the focus function (see examples and demo).

To increase speed at the cost of accuracy and possible false negatives, you can decrease `searchHitsSampleLimit` and/or `topCollocatesLimit` and/or set `exactFrequencies` to FALSE.

Note that currently not the tokenization provided by the backend, i.e. the corpus itself, is used, but a tinkered one. This can also lead to false negatives and to frequencies that differ from corresponding ones acquired via the web user interface.

Value

Tibble with top collocates, association scores, corresponding URLs for web user interface queries, etc.

See Also

Other collocation analysis functions: [association-score-functions](#), [collocationScoreQuery](#), [KorAPConnection-method](#), [synsemanticStopwords\(\)](#)

Examples

```
## Not run:

# Find top collocates of "Packung" inside and outside the sports domain.
new("KorAPConnection", verbose = TRUE) %>%
  collocationAnalysis("Packung", vc=c("textClass=sport", "textClass!=sport"),
    leftContextSize=1, rightContextSize=1, topCollocatesLimit=20) %>%
  dplyr::filter(logDice >= 5)

## End(Not run)
```

```
## Not run:

# Identify the most prominent light verb construction with "in ... setzen".
# Note that, currently, the use of focus function disallows exactFrequencies.
new("KorAPConnection", verbose = TRUE) %>%
  collocationAnalysis("focus(in [tt/p=NN] {[tt/l=setzen]})",
    leftContextSize=1, rightContextSize=0, exactFrequencies=FALSE, topCollocatesLimit=20)

## End(Not run)
```

```
collocationScoreQuery,KorAPConnection-method
```

Query frequencies of a node and a collocate and calculate collocation association scores

Description

Computes various collocation association scores based on [frequencyQuery\(\)](#)s for a target word and a collocate.

Usage

```
## S4 method for signature 'KorAPConnection'
collocationScoreQuery(
  kco,
  node,
  collocate,
  vc = "",
  lemmatizeNodeQuery = FALSE,
  lemmatizeCollocateQuery = FALSE,
  leftContextSize = 5,
  rightContextSize = 5,
  scoreFunctions = defaultAssociationScoreFunctions(),
  smoothingConstant = 0.5,
  observed = NA,
  ignoreCollocateCase = FALSE,
  withinSpan = "base/s=s"
)
```

Arguments

| | |
|-----------|---|
| kco | KorAPConnection() object (obtained e.g. from <code>new("KorAPConnection")</code>) |
| node | target word |
| collocate | collocate of target word |
| vc | string describing the virtual corpus in which the query should be performed. An empty string (default) means the whole corpus, as far as it is license-wise accessible. |

| | |
|-------------------------|--|
| lemmatizeNodeQuery | logical, set to TRUE if node query should be lemmatized, i.e. x -> [tt/l=x] |
| lemmatizeCollocateQuery | logical, set to TRUE if collocate query should be lemmatized, i.e. x -> [tt/l=x] |
| leftContextSize | size of the left context window |
| rightContextSize | size of the right context window |
| scoreFunctions | named list of score functions of the form function(O1, O2, O, N, E, window_size), see e.g. pmi |
| smoothingConstant | smoothing constant will be added to all observed values |
| observed | if collocation frequencies are already known (or estimated from a sample) they can be passed as a vector here, otherwise: NA |
| ignoreCollocateCase | logical, set to TRUE if collocate case should be ignored |
| withinSpan | KorAP span specification for collocations to be searched within |

Value

tibble with query KorAP web request URL, all observed values and association scores

See Also

Other collocation analysis functions: [association-score-functions](#), [collocationAnalysis, KorAPConnection-method](#), [synsemanticStopwords\(\)](#)

Examples

```
## Not run:

new("KorAPConnection", verbose = TRUE) %>%
  collocationScoreQuery("Grund", "triftiger")

## End(Not run)

## Not run:

new("KorAPConnection", verbose = TRUE) %>%
  collocationScoreQuery("Grund", c("guter", "triftiger"),
    scoreFunctions = list(localMI = function(O1, O2, O, N, E, window_size) { 0 * log2(O/E) }) )

## End(Not run)

## Not run:

library(highcharter)
library(tidyr)
new("KorAPConnection", verbose = TRUE) %>%
```

```

collocationScoreQuery("Team", "agil", vc = paste("pubDate in", c(2014:2018)),
                      lemmatizeNodeQuery = TRUE, lemmatizeCollocateQuery = TRUE) %>%
  pivot_longer(14:last_col(), names_to = "measure", values_to = "score") %>%
  hchart(type="spline", hcaes(label, score, group=measure)) %>%
  hc_add_onclick_korap_search()

## End(Not run)

```

corpusStats, KorAPConnection-method

Fetch information about a (virtual) corpus

Description

Fetch information about a (virtual) corpus

Usage

```

## S4 method for signature 'KorAPConnection'
corpusStats(kco, vc = "", verbose = kco@verbose, as.df = FALSE)

```

Arguments

| | |
|---------|--|
| kco | KorAPConnection() object (obtained e.g. from <code>new("KorAPConnection")</code>) |
| vc | string describing the virtual corpus. An empty string (default) means the whole corpus, as far as it is license-wise accessible. |
| verbose | logical. If TRUE, additional diagnostics are printed. |
| as.df | return result as data frame instead of as S4 object? |

Value

KorAPCorpusStats object with the slots documents, tokens, sentences, paragraphs

Examples

```

## Not run:

kco <- new("KorAPConnection")
corpusStats(kco, "pubDate in 2017 & textType=/Zeitung.*/")

## End(Not run)

```

 hc_add_onclick_korap_search

Add KorAP search click events to highchart plots

Description

[Experimental]

Adds on-click events to data points of highcharts that were constructed with [frequencyQuery\(\)](#) or [collocationScoreQuery\(\)](#). Clicks on data points then launch KorAP web UI queries for the given query term and virtual corpus in a separate tab.

Usage

```
hc_add_onclick_korap_search(hc)
```

Arguments

hc A highchart htmlwidget object generated by e.g. [frequencyQuery\(\)](#).

Value

The input highchart object with added on-click events.

See Also

Other highcharter-helpers: [hc_freq_by_year_ci\(\)](#)

Examples

```
## Not run:

library(highcharter)
library(tidyr)

new("KorAPConnection", verbose = TRUE) %>%
  collocationScoreQuery("Team", "agil", vc = paste("pubDate in", c(2014:2018)),
    lemmatizeNodeQuery = TRUE, lemmatizeCollocateQuery = TRUE) %>%
    pivot_longer(c("O", "E")) %>%
  hchart(type="spline", hcaes(label, value, group=name)) %>%
  hc_add_onclick_korap_search()

## End(Not run)
```

hc_freq_by_year_ci *Plot interactive frequency curves with confidence intervals*

Description

[Experimental]

Convenience function for plotting typical frequency by year graphs with confidence intervals using highcharter.

Warning: This function may be moved to a new package.

Usage

```
hc_freq_by_year_ci(
  df,
  as.alternatives = FALSE,
  ylabel = if (as.alternatives) "%" else "ipm",
  smooth = FALSE,
  ...
)
```

Arguments

| | |
|-----------------|---|
| df | data frame like the value of a frequencyQuery() |
| as.alternatives | boolean decides whether queries should be treated as mutually exclusive and exhaustive wrt. to some meaningful class (e.g. spelling variants of a certain word form). |
| ylabel | defaults to % if as.alternatives is TRUE and to ipm otherwise. |
| smooth | boolean decides whether the graph is smoothed using the highcharts plot types spline and areasplinerange. |
| ... | additional arguments passed to hc_add_series() |

Value

A highchart htmlwidget object containing the frequency plot.

See Also

Other highcharter-helpers: [hc_add onclick_korap_search\(\)](#)

Examples

```
## Not run:

year <- c(1990:2018)
alternatives <- c("macht []{0,3} Sinn", "ergibt []{0,3} Sinn")
```

```

new("KorAPConnection", verbose = TRUE) %>%
  frequencyQuery(query = alternatives,
                 vc = paste("textType = /Zeit.* / & pubDate in", year),
                 as.alternatives = TRUE) %>%
  hc_freq_by_year_ci(as.alternatives = TRUE)

kco <- new("KorAPConnection", verbose = TRUE)
expand_grid(
  condition = c("textDomain = /Wirtschaft.* /", "textDomain != /Wirtschaft.* /"),
  year = (2005:2011)
) %>%
  cbind(frequencyQuery(
    kco,
    "[[tt/l=Heuschrecke]",
    paste0(.$condition, " & pubDate in ", .$year)
  )) %>%
  hc_freq_by_year_ci()

## End(Not run)

```

KorAPConnection-class *Class KorAPConnection*

Description

KorAPConnection objects represent the connection to a KorAP server. New KorAPConnection objects can be created by `new("KorAPConnection")`.

Usage

```

## S4 method for signature 'KorAPConnection'
initialize(
  .Object,
  KorAPUrl = "https://korap.ids-mannheim.de/",
  apiVersion = "v1.0",
  apiUrl,
  accessToken = getAccessToken(KorAPUrl),
  userAgent = "R-KorAP-Client",
  timeout = 240,
  verbose = FALSE,
  cache = TRUE
)

## S4 method for signature 'KorAPConnection'
persistAccessToken(kco, accessToken = kco@accessToken)

## S4 method for signature 'KorAPConnection'

```

```

clearAccessToken(kco)

## S4 method for signature 'KorAPConnection'
apiCall(
  kco,
  url,
  json = TRUE,
  getHeaders = FALSE,
  cache = kco@cache,
  timeout = kco@timeout
)

## S4 method for signature 'KorAPConnection'
clearCache(kco)

## S4 method for signature 'KorAPConnection'
show(object)

```

Arguments

| | |
|-------------|--|
| .Object | KorAPConnection object |
| KorAPUrl | URL of the web user interface of the KorAP server instance you want to access. |
| apiVersion | which version of KorAP's API you want to connect to. |
| apiUrl | URL of the KorAP web service. |
| accessToken | <p>OAuth2 access token. For queries on corpus parts with restricted access (e.g. textual queries on IPR protected data), you need to authorize your application with an access token. How to obtain an access token for the DeReKo KorAP instance is explained in the authorization section of the RKorAPClient Readme on GitHub.</p> <p>To use authorization based on an access token in subsequent queries, initialize your KorAP connection with:</p> <pre>kco <- new("KorAPConnection", accessToken="<access token>")</pre> <p>In order to make the API token persistent for the currently used KorAPUrl (you can have one token per KorAPUrl / KorAP server instance), use:</p> <pre>persistAccessToken(kco)</pre> <p>This will store it in your keyring using the keyring() package. Subsequent new("KorAPConnection") calls will then automatically retrieve the token from your keyring. To stop using a persisted token, call clearAccessToken(kco). Please note that for DeReKo, authorized queries will behave differently inside and outside the IDS, because of the special license situation. This concerns also cached results which do not take into account from where a request was issued. If you experience problems or unexpected results, please try kco <- new("KorAPConnection", cache=FALSE) or use clearCache() to clear the cache completely.</p> |
| userAgent | user agent string. |

| | |
|------------|---|
| timeout | tineout in seconds for API requests (this does not influence server internal time-outs). |
| verbose | logical that decides whether following operations will default to be verbose. |
| cache | logical that decides if API calls are cached locally. You can clear the cache with clearCache() . |
| kco | KorAPConnection object |
| url | request url |
| json | logical that determines if json result is expected |
| getHeaders | logical that determines if headers and content should be returned (as a list) |
| object | KorAPConnection object |

Value

[KorAPConnection\(\)](#) object that can be used e.g. with [corpusQuery\(\)](#)

Slots

`KorAPUrl` URL of the web user interface of the KorAP server used in the connection.
`apiVersion` requested KorAP API version.
`indexRevision` indexRevision code as reported from API via X-Index-Revision HTTP header.
`apiUrl` full URL of API including version.
`accessToken` OAuth2 access token.
`userAgent` user agent string used for connection the API.
`timeout` tineout in seconds for API requests (this does not influence server internal timeouts)
`verbose` logical that decides whether operations will default to be verbose.
`cache` logical that decides if API calls are cached locally.
`welcome` list containing HTTP response received from KorAP server welcome function.

Examples

```
## Not run:

kcon <- new("KorAPConnection", verbose = TRUE)
kq <- corpusQuery(kcon, "Ameisenplage")
kq <- fetchAll(kq)

## End(Not run)

## Not run:

kcon <- new("KorAPConnection", verbose = TRUE, accessToken="e739u6e0zkwADQPdVChxFg")
kq <- corpusQuery(kcon, "Ameisenplage", metadataOnly=FALSE)
kq <- fetchAll(kq)
kq@collectedMatches$snippet
```

```
## End(Not run)

## Not run:

kco <- new("KorAPConnection", accessToken="e739u6e0zkwADQPdVChxFg")
persistAccessToken(kco)

## End(Not run)

## Not run:

kco <- new("KorAPConnection")
clearAccessToken(kco)

## End(Not run)
```

KorAPCorpusStats-class

Class KorAPCorpusStats

Description

KorAPCorpusStats objects can hold information about a corpus or virtual corpus. KorAPCorpusStats objects can be obtained by the [corpusStats\(\)](#) method.

Usage

```
## S4 method for signature 'KorAPCorpusStats'
show(object)
```

Arguments

object KorAPCorpusStats object

Slots

vc definition of the virtual corpus
tokens number of tokens
documents number of documents
sentences number of sentences
paragraphs number of paragraphs

KorAPQuery-class *Class KorAPQuery*

Description

This class provides methods to perform different kinds of queries on the KorAP API server. KorAPQuery objects, which are typically created by the `corpusQuery()` method, represent the current state of a query to a KorAP server.

`corpusQuery` performs a corpus query via a connection to a KorAP-API-server

`fetchNext` fetches the next bunch of results of a KorAP query.

`fetchAll` fetches all results of a KorAP query.

`frequencyQuery` combines `corpusQuery()`, `corpusStats()` and `ci()` to compute a table with the relative frequencies and confidence intervals of one or multiple search terms across one or multiple virtual corpora.

Usage

```
## S4 method for signature 'KorAPQuery'
initialize(
  .Object,

Arguments

| | |
|--------------------|--|
| .Object | ... |
| korapConnection | KorAPConnection object |
| request | query part of the request URL |
| vc | string describing the virtual corpus in which the query should be performed. An empty string (default) means the whole corpus, as far as it is license-wise accessible. |
| totalResults | number of hits the query has yielded |
| nextStartIndex | at what index to start the next fetch of query results |
| fields | (meta)data fields that will be fetched for every match. |
| requestUrl | complete URL of the API request |
| webUIRequestUrl | URL of a web frontend request corresponding to the API request |
| apiResponse | data-frame representation of the JSON response of the API request |
| hasMoreMatches | logical that signals if more query results can be fetched |
| collectedMatches | matches already fetched from the KorAP-API-server |
| kco | KorAPConnection() object (obtained e.g. from <code>new("KorAPConnection")</code>) |
| query | string that contains the corpus query. The query language depends on the <code>ql</code> parameter. Either query must be provided or <code>KorAPUrl</code> . |
| KorAPUrl | instead of providing the query and <code>vc</code> string parameters, you can also simply copy a KorAP query URL from your browser and use it here (and in <code>KorAPConnection</code>) to provide all necessary information for the query. |
| metadataOnly | logical that determines whether queries should return only metadata without any snippets. This can also be useful to prevent access rewrites. Note that the default value is TRUE. If you want your corpus queries to return not only metadata, but also KWICS, you need to authorize your <code>RKorAPClient</code> application as explained in the authorization section of the <code>RKorAPClient</code> Readme on GitHub and set the <code>metadataOnly</code> parameter to FALSE. |
| ql | string to choose the query language (see section on Query Parameters in the <code>Kustvakt-Wiki</code> for possible values). |
| accessRewriteFatal | abort if query or given <code>vc</code> had to be rewritten due to insufficient rights (not yet implemented). |
| verbose | print progress information if true |
| expand | logical that decides if query and <code>vc</code> parameters are expanded to all of their combinations |

| | |
|---------------------------------|---|
| <code>as.df</code> | return result as data frame instead of as S4 object? |
| <code>context</code> | string that specifies the size of the left and the right context returned in snippet (provided that <code>metadataOnly</code> is set to <code>false</code> and that the necessary access right are met). The format of the context size specification (e.g. <code>3-token,3-token</code>) is described in the Service: Search GET documentation of the Kustvakt Wiki . If the parameter is not set, the default context size specification of the KorAP server instance will be used. Note that you cannot overrule the maximum context size set in the KorAP server instance, as this is typically legally motivated. |
| <code>kqo</code> | object obtained from <code>corpusQuery()</code> |
| <code>offset</code> | start offset for query results to fetch |
| <code>maxFetch</code> | maximum number of query results to fetch |
| <code>randomizePageOrder</code> | fetch result pages in pseudo random order if true. Use <code>set.seed()</code> to set seed for reproducible results. |
| <code>...</code> | further arguments passed to or from other methods |
| <code>conf.level</code> | confidence level of the returned confidence interval (passed through <code>ci()</code> or <code>prop.test()</code>). |
| <code>as.alternatives</code> | LOGICAL that specifies if the query terms should be treated as alternatives. If <code>as.alternatives</code> is TRUE, the sum over all query hits, instead of the respective <code>vc</code> token sizes is used as total for the calculation of relative frequencies. |
| <code>x</code> | KorAPQuery object |
| <code>object</code> | KorAPQuery object |

Value

Depending on the `as.df` parameter, a table or a `KorAPQuery()` object that, among other information, contains the total number of results in `@totalResults`. The resulting object can be used to fetch all query results (with `fetchAll()`) or the next page of results (with `fetchNext()`). A corresponding URL to be used within a web browser is contained in `@webUIRequestUrl`. Please make sure to check `$collection$rewrites` to see if any unforeseen access rewrites of the query's virtual corpus had to be performed.

The `kqo` input object with updated slots `collectedMatches`, `apiResponse`, `nextStartIndex`, `hasMoreMatches`

synsemanticStopwords *Preliminary synsemantic stopwords function*

Description

[Experimental]

Preliminary synsemantic stopwords function to be used in collocation analysis.

Usage

```
synsemanticStopwords(...)
```

Arguments

... future arguments for language detection

Details

Currently only suitable for German. See stopwords package for other languages.

Value

Vector of synsemantic stopwords.
